Intuitionistic Fixed Point Logic and Program Extraction (with Prawf)

Olga Petrovska
(joint work with Ulrich Berger (SU) and Hideki Tsuiki (Kyoto University))
6-8 April, BCTCS 2020 (Coronavirus Edition)

This work was supported by the Marie Curie International Research Staff Exchange Schemes Computable Analysis (PIRES-GA-2011-294962) and Correctness by Construction (FP7-PEOPLE-2013-IRSES-612638) as well as the Marie Curie RISE project Computing with Infinite Data (H2020-MSCA-RISE-2016-731143) and the EPSRC Doctoral Training Grant No. 1818640.
Motivation

Creating a formal system exploiting Curry-Howard isomorphism to extract useful and ‘correct-by-construction’ programs from proofs about abstract mathematics.

Agenda

• Intuitionistic Fixed Point Logic
• Realizability
• Soundness
• Demo
Intuitionistic Fixed Point Logic (IFP) as a schema

First-order logic with lambda abstractions and fixed point operators

IFP is a schema

(1) Sorts $\iota, \iota_1, \ldots$ as names for spaces of abstract mathematical objects.
(2) Terms $(\vec{t})$ that include variables, constants of fixed sorts $\iota$ and function symbols types $\vec{\iota} \rightarrow \iota$.
(3) Predicate constants of fixed arities $(\vec{\iota})$.

Formulas $\ni A, B$ ::=
\[ P(\vec{t}) \]
\[ A \land B \mid A \lor B \mid A \rightarrow B \mid \forall x A \mid \exists x A \]

Predicates $\ni P, Q$ ::=
\[ X \mid P \mid \lambda \vec{x} A \mid \mu \Phi \mid \nu \Phi \]

Operators $\ni \Phi, \Psi$ ::=
\[ \lambda X P \ (P \text{ is strictly positive in } X) \]
Intuitionistic Fixed Point Logic (IFP)

- Intuitionistic Predicate Logic
  - Natural deduction with equality
- Inductions and Coinduction
  \[
  \frac{\Phi(\mu \Phi) \subseteq \mu \Phi}{\mu \Phi \subseteq P} \quad \text{ind}
  \]
  \[
  \frac{\Phi(P) \subseteq P}{\mu \Phi \subseteq P} \quad \text{cl}
  \]
  \[
  \frac{\nu \Phi \subseteq \Phi(\nu \Phi)}{\nu \Phi \subseteq \Phi(\nu \Phi)} \quad \text{coind}
  \]
  \[
  \frac{P \subseteq \Phi(P)}{P \subseteq \nu \Phi}
  \]
- Axioms consisting of closed disjunction-free formulas
  e.g., \( \forall x, y(x + y = y + x) \)
A *realizer* is an object that “realizes” a formula from a formal theory, i.e. serves as a confirmation of its truth.

**IFP for Realisers (RIFP)**

The Scott domain of realizers is defined by the recursive domain equation

\[
D = \text{Nil} + \text{Lt}(D) + \text{Rt}(D) + \text{Pair}(D \times D) + \text{F}(D \to D)
\]

where $+$ denotes the separated sum, $\times$ the Cartesian product and $D \to D$ is the continuous function space.
A Harrop expression contains no disjunction or free predicate variable at a strictly positive position \(^1\).

A non-computational expression contains neither disjunctions nor free predicate variable.

\(^1\)predicate variable is not free in the premise of an implication
Realizability and Simplified Realizability

We assigning to every

- non-Harrop formula $A$ a predicate $R(A)$ with one argument for realizers
- non-Harrop predicate $P$ a predicate $R(P)$ with an extra argument for realizers
- non-Harrop operator $\Phi$ an operator $R(\Phi)$ with an extra argument for realizers

- Harrop formula $A$ a formula $H(A)$
- Harrop predicate $P$ a predicate $H(P)$ of the same arity
- Harrop operator $\Phi$ an operator $H(\Phi)$ of the same arity
Realizability interpretation

\[ a \vdash A = \mathsf{H}(A) \land a = \text{Nil} \quad (A \text{ Harrop}) \]
\[ \mathsf{R}(P) = \lambda (\vec{x}, a) (\mathsf{H}(P) \land a = \text{Nil}) \quad (P \text{ Harrop}) \]

Otherwise
\[ a \vdash P(\vec{t}) = \mathsf{R}(P)(\vec{t}, a) \]
\[ c \vdash (A \land B) = ((\pi_{1c}) \vdash A \land (\pi_{2c}) \vdash B) \]
\[ \quad \text{(neither } A \text{ nor } B \text{ Harrop}) \]
\[ a \vdash (A \land B) = a \vdash A \land \mathsf{H}(B) \quad (B \text{ Harrop}) \]
\[ b \vdash (A \land B) = \mathsf{H}(A) \land b \vdash B \quad (A \text{ Harrop}) \]
\[ c \vdash (A \lor B) = \exists a (c = \text{Lt}(a) \land a \vdash A \lor c = \text{Rt}(a) \land a \vdash B) \]
\[ f \vdash (A \rightarrow B) = \forall a (a \vdash A \rightarrow (f(a) \vdash B)) \]
\[ \quad \text{(neither } A \text{ nor } B \text{ Harrop}) \]
\[ b \vdash (A \rightarrow B) = \mathsf{H}(A) \rightarrow b \vdash B \quad (A \text{ Harrop}) \]
\[ a \vdash \Diamond x A = \Diamond x (a \vdash A) \quad (\Diamond \in \{\forall, \exists\}) \]
\[ \mathsf{R}(X) = \bar{X} \]
\[ \mathsf{R}(\Diamond \Phi) = \Diamond \mathsf{R}(\Phi) \quad (\Diamond \in \{\nu, \mu\}) \]
\[ \mathsf{R}(\lambda \bar{x} A) = \lambda \bar{x} \mathsf{R}(A) \quad (= \lambda (\bar{x}, a) a \vdash A) \]
\[ \mathsf{R}(\lambda X P) = \lambda X \mathsf{R}(P) \]
\[ \mathsf{H}(P(\vec{t})) = \mathsf{H}(P)(\vec{t}) \]
\[ \mathsf{H}(A \land B) = \mathsf{H}(A) \land \mathsf{H}(B) \]
\[ \mathsf{H}(A \rightarrow B) = a \vdash A \rightarrow \mathsf{H}(B) \]
\[ \mathsf{H}(\Diamond x A) = \Diamond x \mathsf{H}(A) \]
\[ \mathsf{H}(P) = P \]
\[ \mathsf{H}(\Diamond \Phi) = \Diamond \mathsf{H}(\Phi) \]
\[ \mathsf{H}(\lambda \bar{x} A) = \lambda \bar{x} \mathsf{H}(A) \]
\[ \mathsf{H}(\lambda X P) = \lambda X \mathsf{H}_X(P) \]
\( \Gamma, \Delta \vdash_{\text{IFP}} A^* \Rightarrow H(\Gamma), \vec{a} r \Delta \vdash_{\text{RIFP}} p r A, \text{ where } \text{FV}(p) \subseteq \vec{a}. \)

*The admissibility condition is that either \( \Phi \) and \( P \) are both Harrop or both non-Harrop or \( \Phi \) is Harrop and simple and \( P \) is non-Harrop. Simple means that no sub-expression (of an expression in question) of a form \( \mu \Phi \) or \( \nu \Phi \) contains a predicate variable \( X \) free.
IFP’ and the Soundness Theorem

Hideki Tsuiki suggested creating IFP’ to get rid of the admissibility restriction. This also proved to be useful for simplifying program extraction implementation.

Monotonicity of the operator $\Phi$:

$$\text{Mon}(\Phi) \overset{\text{Def}}{=} X \subseteq Y \rightarrow \Phi(X) \subseteq \Phi(Y)$$

where $X$ and $Y$ are fresh variables.

$$\begin{align*}
\frac{\Phi(P) \subseteq P \quad \text{Mon}(\Phi)}{
\mu(\Phi) \subseteq P}
& \quad \text{IND}'(\Phi, P) \quad (*) \\
\frac{P \subseteq \Phi(P) \quad \text{Mon}(\Phi)}{
P \subseteq \nu(\Phi)}
& \quad \text{COIND}'(\Phi, P) \quad (*)
\end{align*}$$

(*) free assumptions in the proof of $\text{Mon}(\Phi)$ must not contain $X$ or $Y$ free.
Soundness proof

$$\Gamma, \Delta \vdash_{\text{IFP}'} A \Rightarrow H(\Gamma), \vec{a} \triangleright \Delta \vdash_{\text{RIFP}} p \triangleright A,$$ where $\text{FV}(p) \subseteq \vec{a}$.

Proof by induction on the length of IFP' derivations.
Soundness proof ii

Ind'. Assume $\Gamma_{IFP'} (\Phi(P) \subseteq P)$, where $\Phi(P) = Q[P/X]$ and $\Gamma_{IFP'} Mon(\Phi)$, i.e. $X \subseteq Y \rightarrow Q \subseteq Q[Y/X]$.

• I.h. $\Gamma_{1nH} \vdash_{RIFP} s r (\Phi(P) \subseteq P)$;
• I.h. $\Gamma_{mon_nh} \vdash_{RIFP} m r (Mon(\Phi))$;

If $\Phi$ and $P$ are non-Harrop show:

\[
fr (\mu(\Phi) \subseteq P) \\
\equiv R(\mu \Phi) \subseteq f^{-1} \circ R(P) \\
= R(\mu(\lambda X Q)) \subseteq f^{-1} \circ R(P) \\
= (\mu(\lambda X \tilde{R}(Q))) \subseteq f^{-1} \circ R(P)
\]

\[
fr (Q \subseteq P) \equiv R(Q) \subseteq f^{-1} \circ R(P) *
\]

* Proven by a separate lemma, which includes a number of equivalences like above
By s.p. induction, it is enough to show

\[ R(Q)[f^{-1} \circ R(P)/\tilde{X}] \subseteq f^{-1} \circ R(P) \]  \hspace{1cm} (1)

By i.h. \textit{1nH} we have: \( s_r(\Phi(P) \subseteq (P)) \), which is equivalent to

\[ R(Q[P/X]) \subseteq s^{-1} \circ R(P) \]  \hspace{1cm} (2)

By i.h. \textit{mon}_{\text{1nH}} we have \( m_r Mon(\Phi) \) and by Lemma (a) this implies

\[ m_r(Mon(\Phi)[P/Y]) \]  \hspace{1cm} (3)

Writing out \( Mon(\Phi)[P/Y] \) we obtain \( X \subseteq P \rightarrow Q \subseteq Q[P/X] \). Hence, 3 can be rewritten as

\[ \forall g(g_r(X \subseteq P) \rightarrow (m_g)r(Q \subseteq Q[P/X])) \]

\[ \equiv \forall g(R(X) \subseteq g^{-1} \circ R(P) \rightarrow R(Q) \subseteq (m_g)^{-1} \circ R(Q[P/X])) \text{ by the equivalences lemma} \]

\[ = \forall g(\tilde{X} \subseteq g^{-1} \circ R(P) \rightarrow R(Q) \subseteq (m_g)^{-1} \circ R(Q[P/X])) \text{ by def. of } R(X) \]

(a) If RIFP proves \( a_r A \) from assumptions that do not contain the predicate variable \( X \) and if \( P \) is a non-Harrop predicate of the same arity as \( X \), then RIFP proves \( a_r (A[P/X]) \) from the same assumptions.
∀g(\tilde{X} \subseteq g^{-1} \circ R(P) \rightarrow R(Q) \subseteq (m \circ g)^{-1} \circ R(Q[P/X]))

If we define \( g \) as \( f \) and \( \tilde{X} = f^{-1} \circ R(P) \) and use Lemma (b), we get
\[
R(Q)[f^{-1} \circ R(P)/\tilde{X}] \subseteq (m \circ f)^{-1} \circ R(Q[P/X])
\]
\[
\subseteq (m \circ f)^{-1} \circ (s^{-1} \circ R(P)) \quad \text{by 2}
\]
\[
= (s \circ m \circ f)^{-1} \circ R(P) \quad \text{by the equivalences lemma}
\]

Hence, the realiser is recursively defined as \( f = s \circ m \circ f \)

(b) If IFP, IFP', or RIFP proves \( \Gamma \vdash A \), then the same system proves \( \Gamma[P/X] \vdash A[P/X], \Gamma[P/X] \vdash A[P/X] \), where \( A, P, X \) are arbitrary formulas, predicates, predicate variables, respectively, and \( \tilde{X} \) is an arbitrary predicate constant that does not appear in any axiom.
Key points before the demo

- IFP is a scheme
  more flexibility, abstraction (e.g., list reversal, translation between representations)
- Use of classical logic as long as it is disjunction-free
- Prawf is build specifically for the purpose of program extraction
Demo
Future work

• Extensions for sequent calculus proofs (Yvett Szilagyi)
• Extension for CFP (Concurrent Fixed Point Logic)
• Developing theorems database in Prawf
